

Sydney Olympic Aquatic Centre, 2–20 March 2026: 19 days of five-minute data from a 535 m² uncovered PVT array, 17 of 19 days operating. Both models were driven by the measured irradiance, inlet and ambient series rather than by typical meteorological year weather. The measured total is the quality-controlled figure; naive integration of the raw power column gives 6,426 kWh. A single autumn campaign at one site is a reality check, not a general validation of the annual estimates.
